

Remote Work and Productivity

Remote work can improve employee productivity when workers have a quiet workspace and clear goals. A 2024 internal survey at a fictional software company found that employees working from home two days per week reported fewer interruptions and saved an average of 45 minutes of commuting time per day.

However, fully remote teams sometimes reported slower communication and fewer informal discussions. The company concluded that a hybrid schedule of two to three remote days per week worked best for its teams.
